Kamu Evrak

AI Assistant for Public Sector Correspondence

Screens captured from the live system at https://kamu-evrak.onrender.com on 9 August 2026. The interface is in Turkish because the product is built for Turkish public administration: the formal register, the legislation and the organisational map are all Turkish, and a translated interface would not be the product. Each screen below carries an English explanation, and the recurring interface words are translated here.

Yazı İşleri Müdürlüğü
Records office

Kurum / Birim
Institution / administrative unit

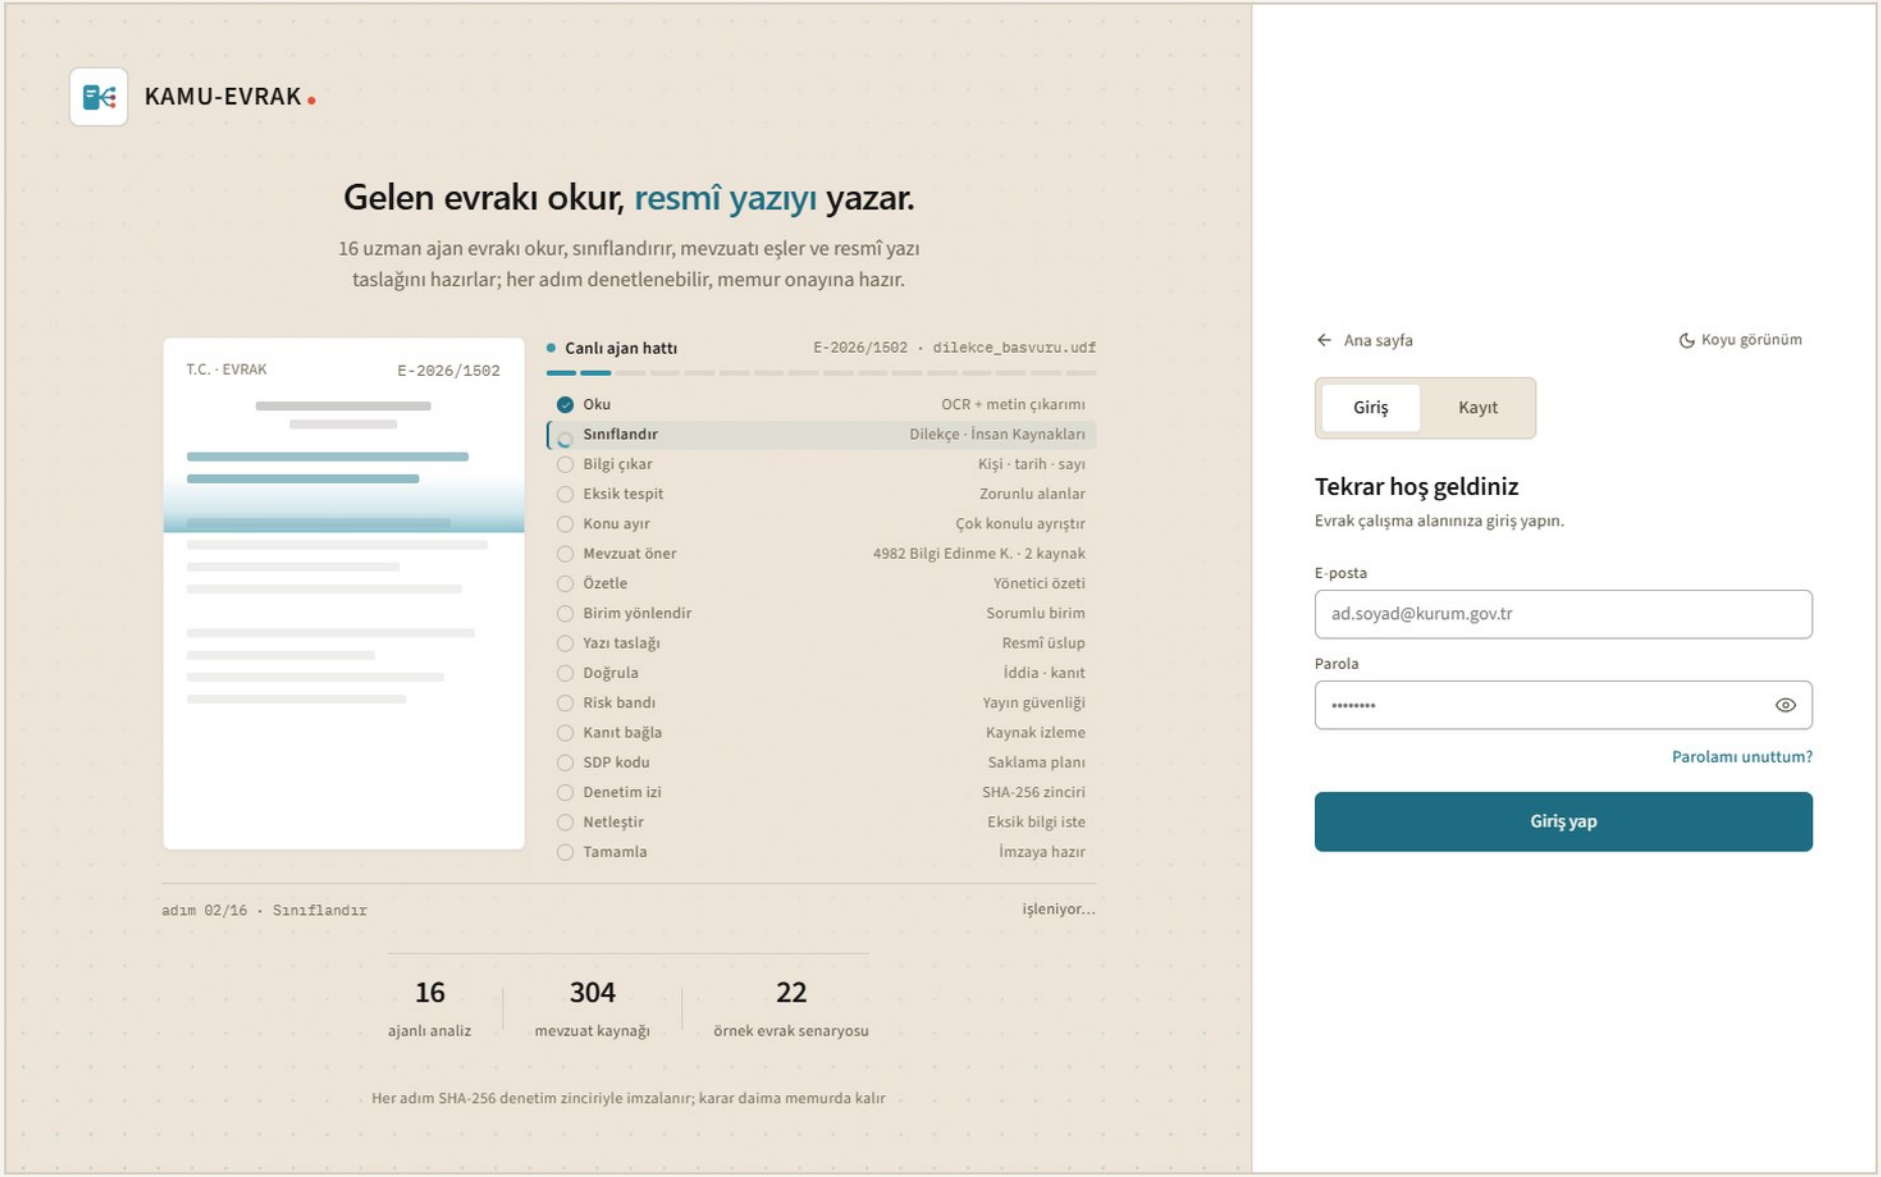

01 What it is

Kamu Evrak is a working web application for Turkish public administration. It reads an incoming official document, understands it, routes it to the correct administrative unit and drafts the formal reply, with every legal citation traced to its source.

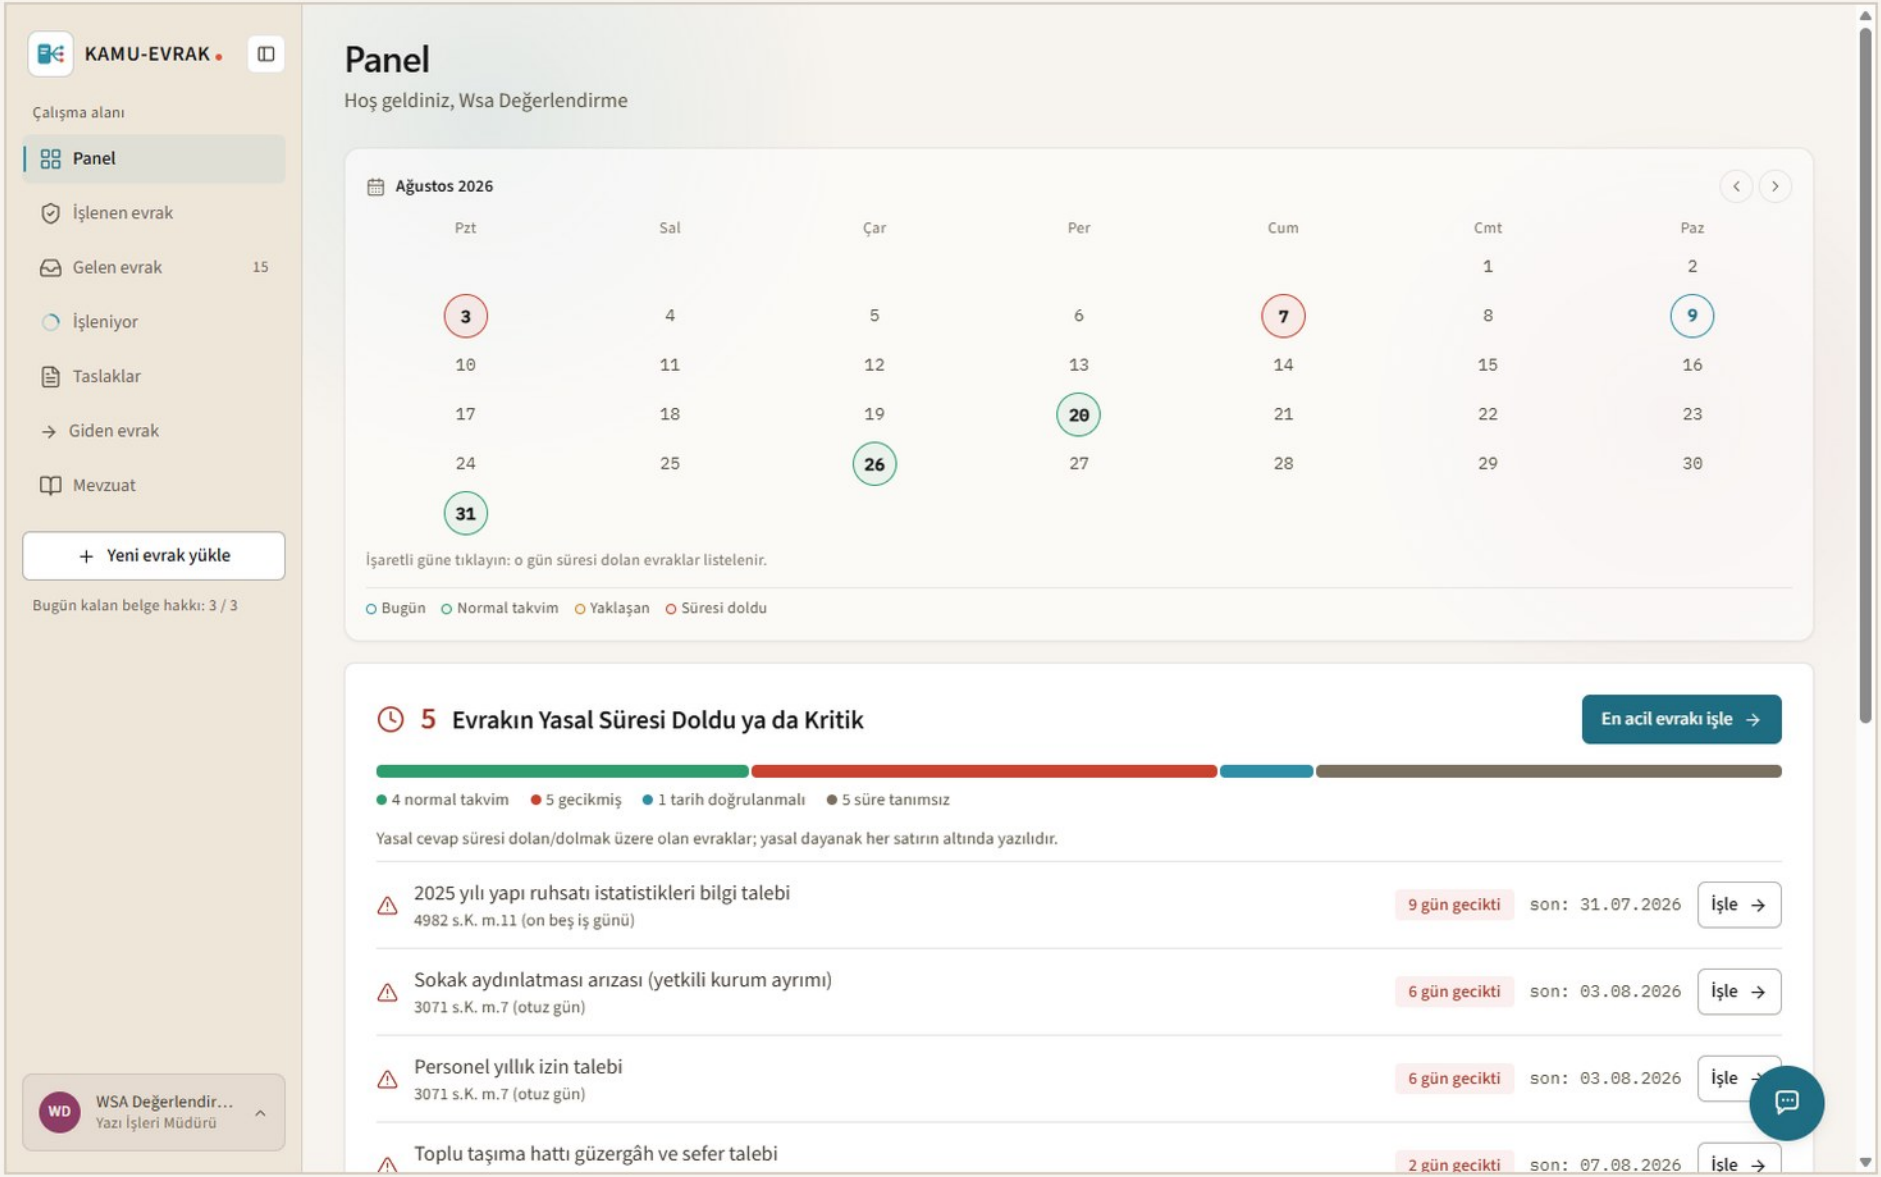

02 Sixteen specialist agents, not one black box

The sign-in screen shows the pipeline that runs on every document: read, classify, extract, detect missing fields, match legislation, summarise, route, draft, verify, risk-band, archive, audit. Each step is inspectable and signed into a SHA-256 audit chain.

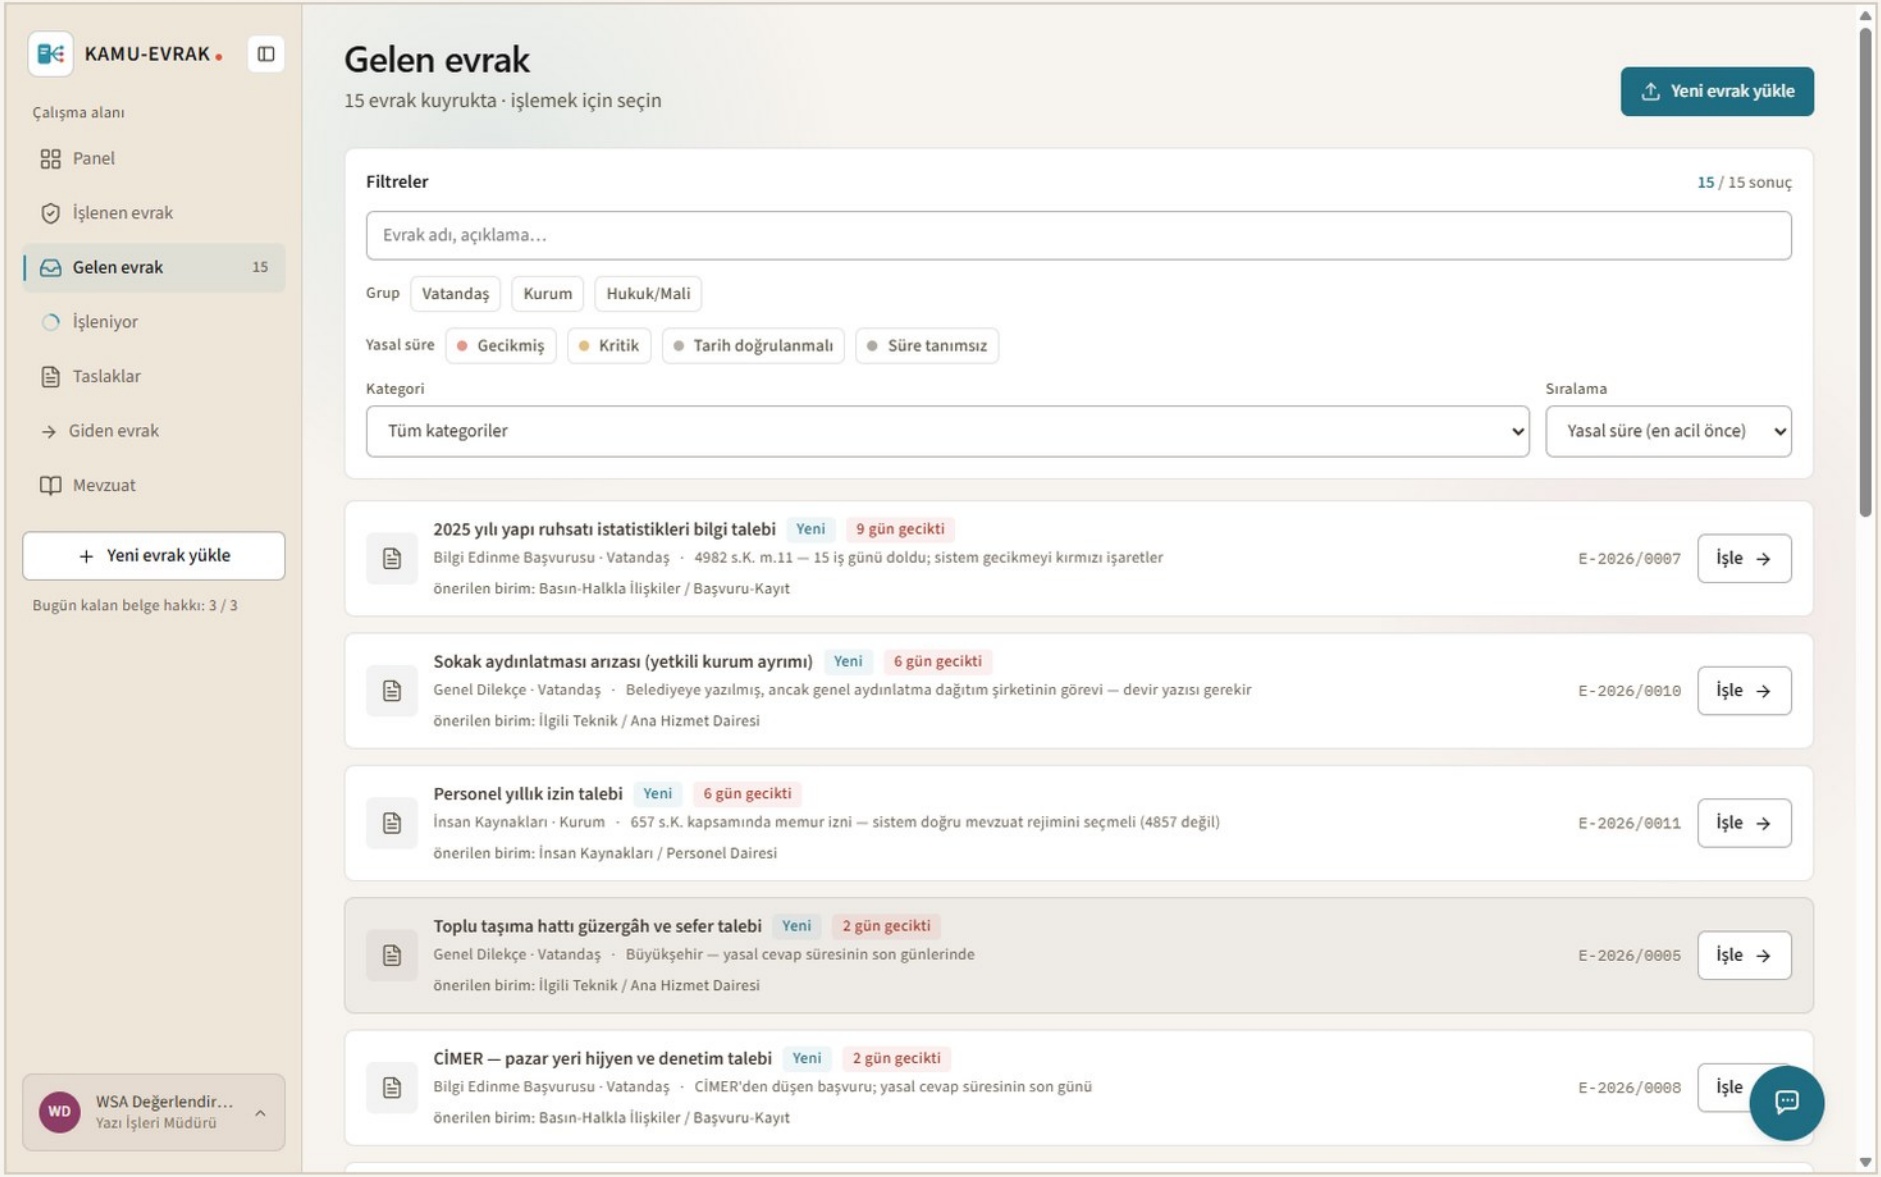

03 Statutory deadlines, tracked

Turkish law sets binding response times for citizen petitions (Law 3071) and information requests (Law 4982). Paper workflows miss them silently. The dashboard shows what is overdue and what is about to be, each row citing the article and the limit it comes from.

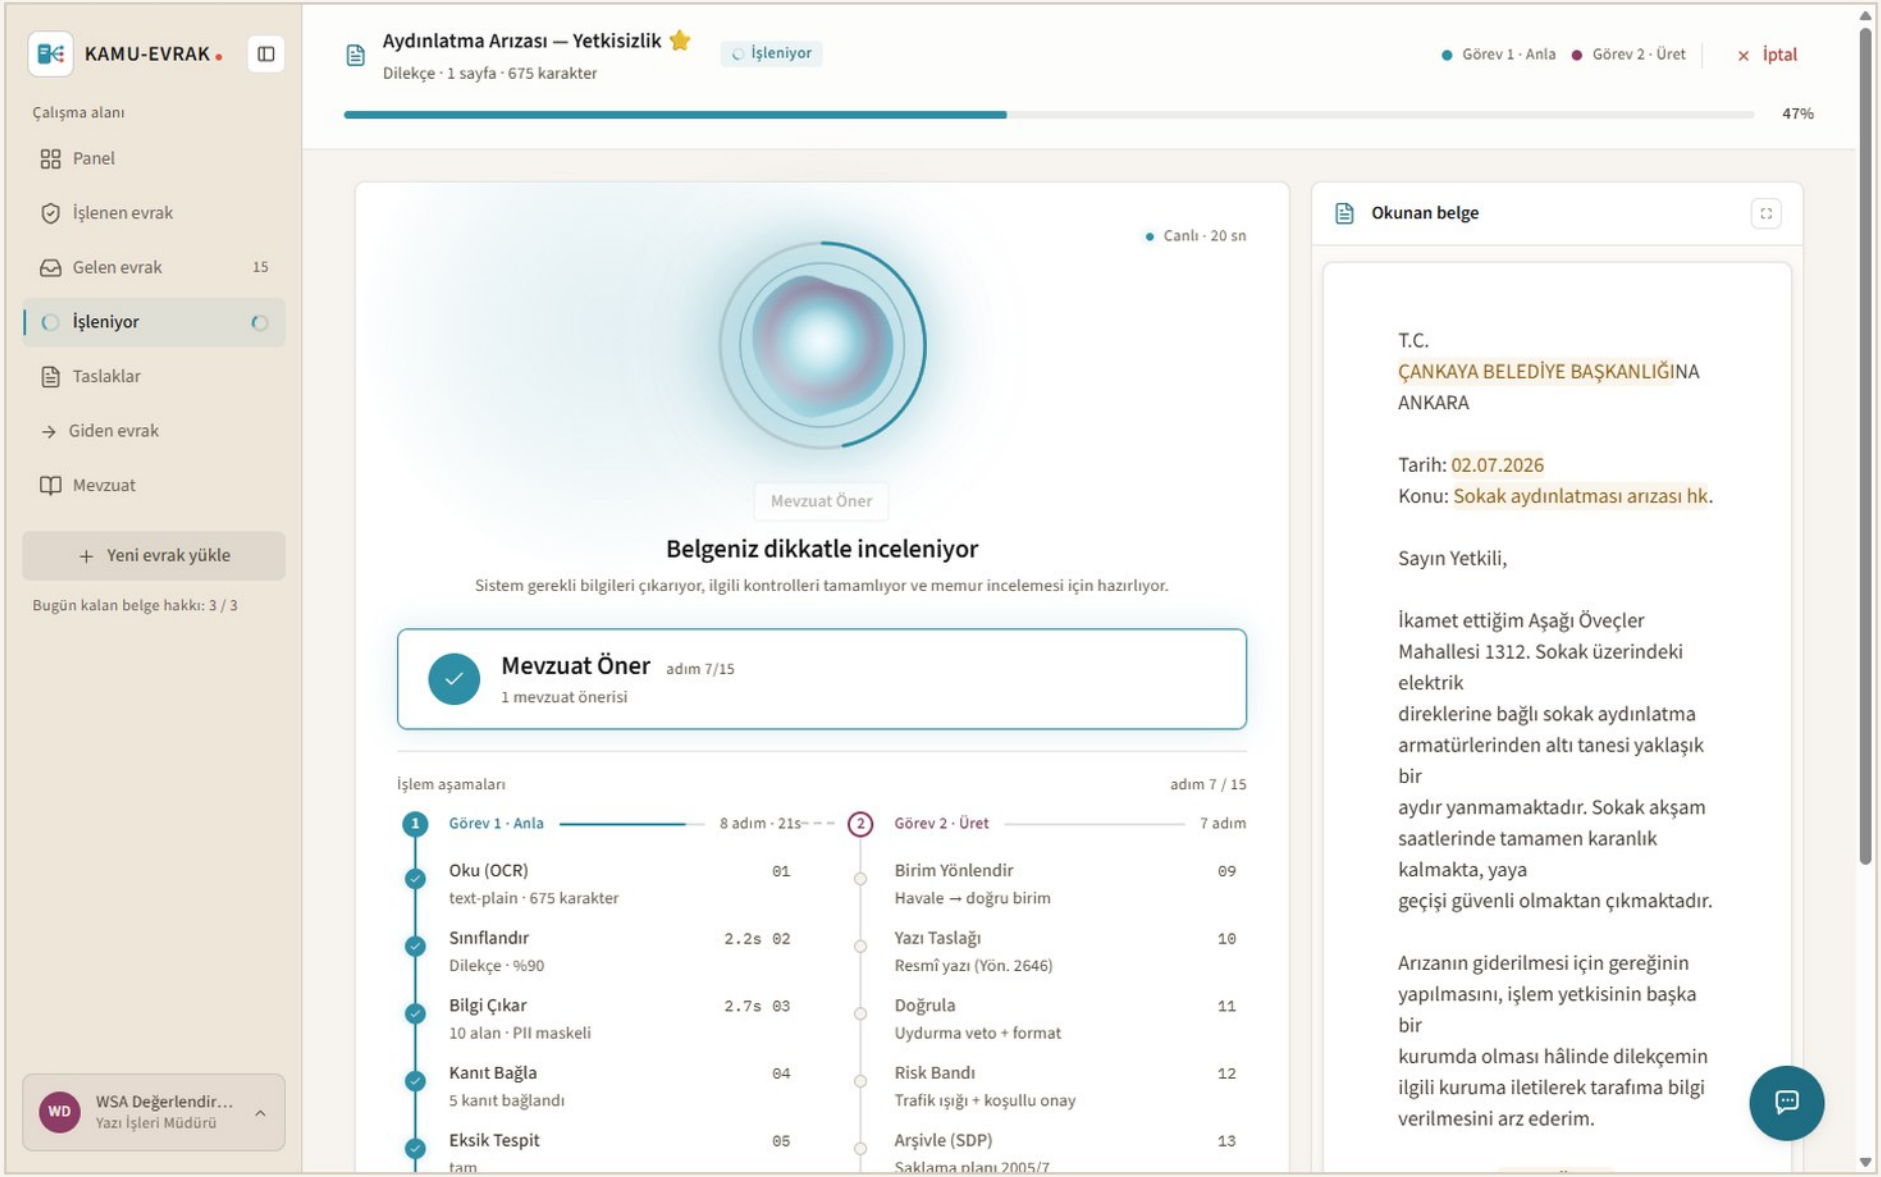

04 The inbox

Incoming documents ordered by legal urgency rather than arrival time. Each row already carries a proposed responsible unit before anyone opens it.

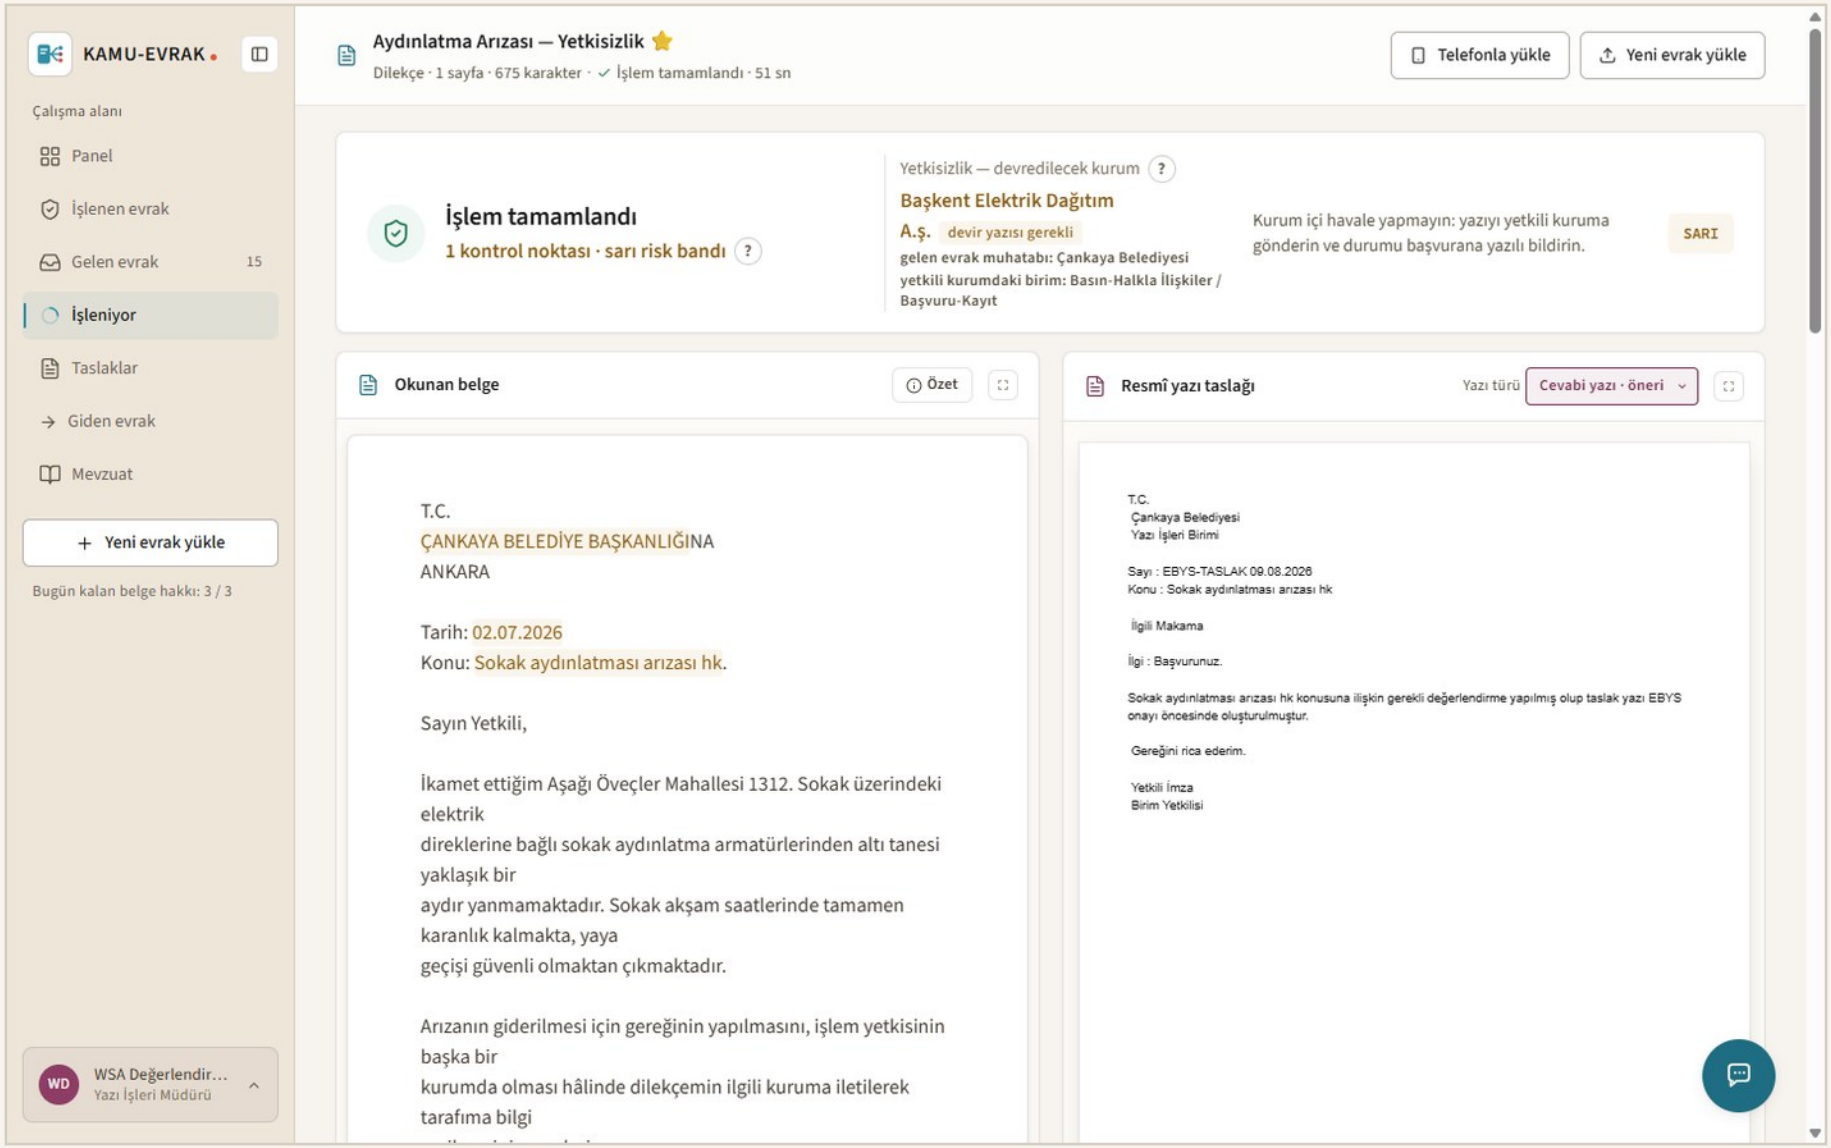

05 The pipeline, live

The officer watches the analysis happen step by step, with the source document beside it. Each step reports what it found: document type and confidence, fields extracted with personal data masked, evidence items grounded in the legislation corpus.

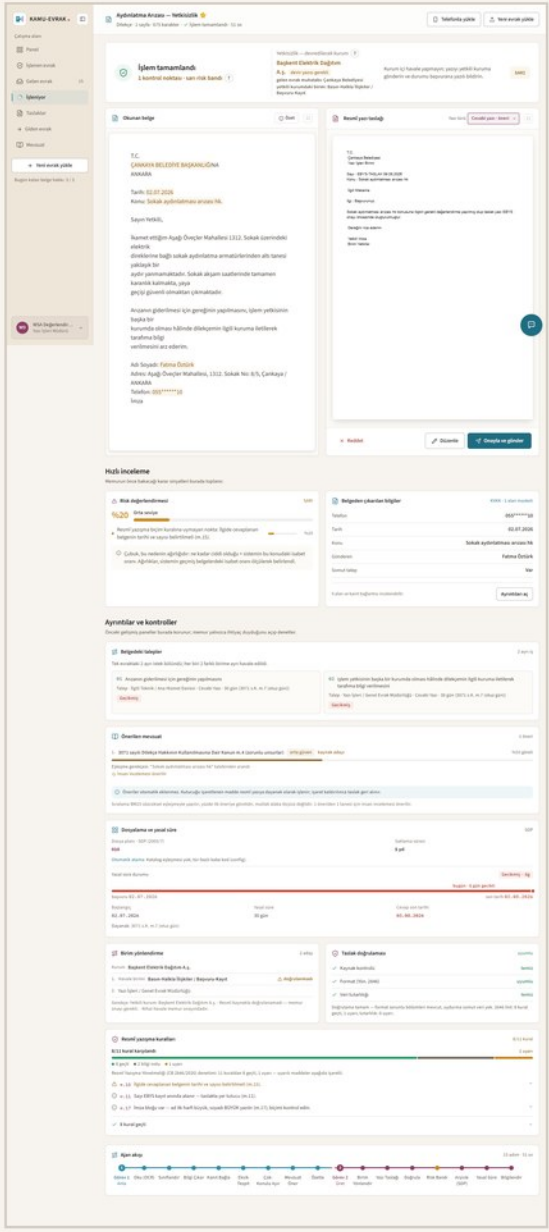

06 It caught that the municipality was the wrong authority

A citizen wrote to the municipality about broken street lighting. The system determined that the municipality is not the competent authority, identified the correct one (the regional electricity distribution company) and told the officer what to do: do not route this internally, send the letter to the competent institution and notify the applicant in writing. It raised a yellow risk band instead of producing a confident wrong answer. Completed in 51 seconds. On the right, the drafted letter in correct formal Turkish register.

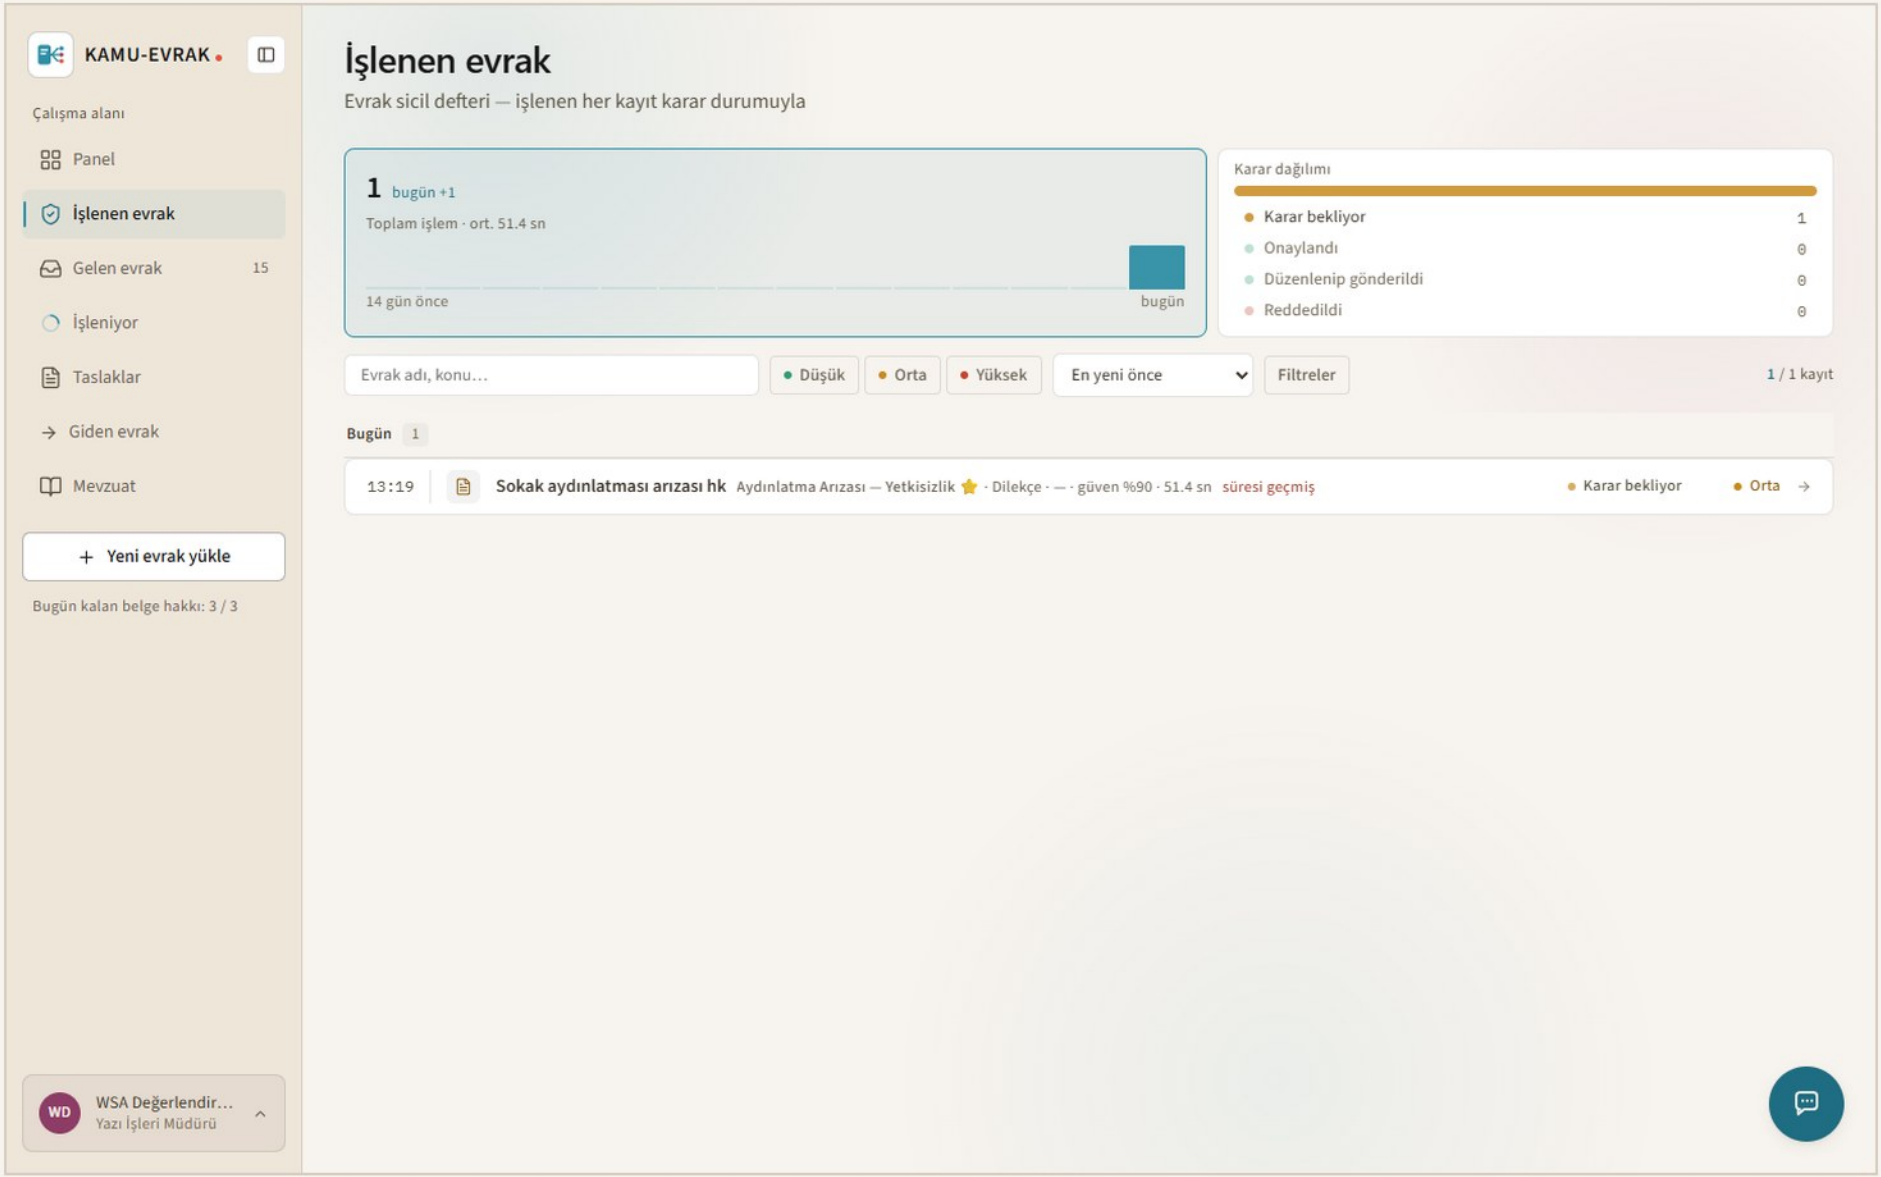

07 Full result view

Source document, extracted fields, legal grounding, generated letter, risk assessment and archival file plan on one screen, ready for the officer's decision.

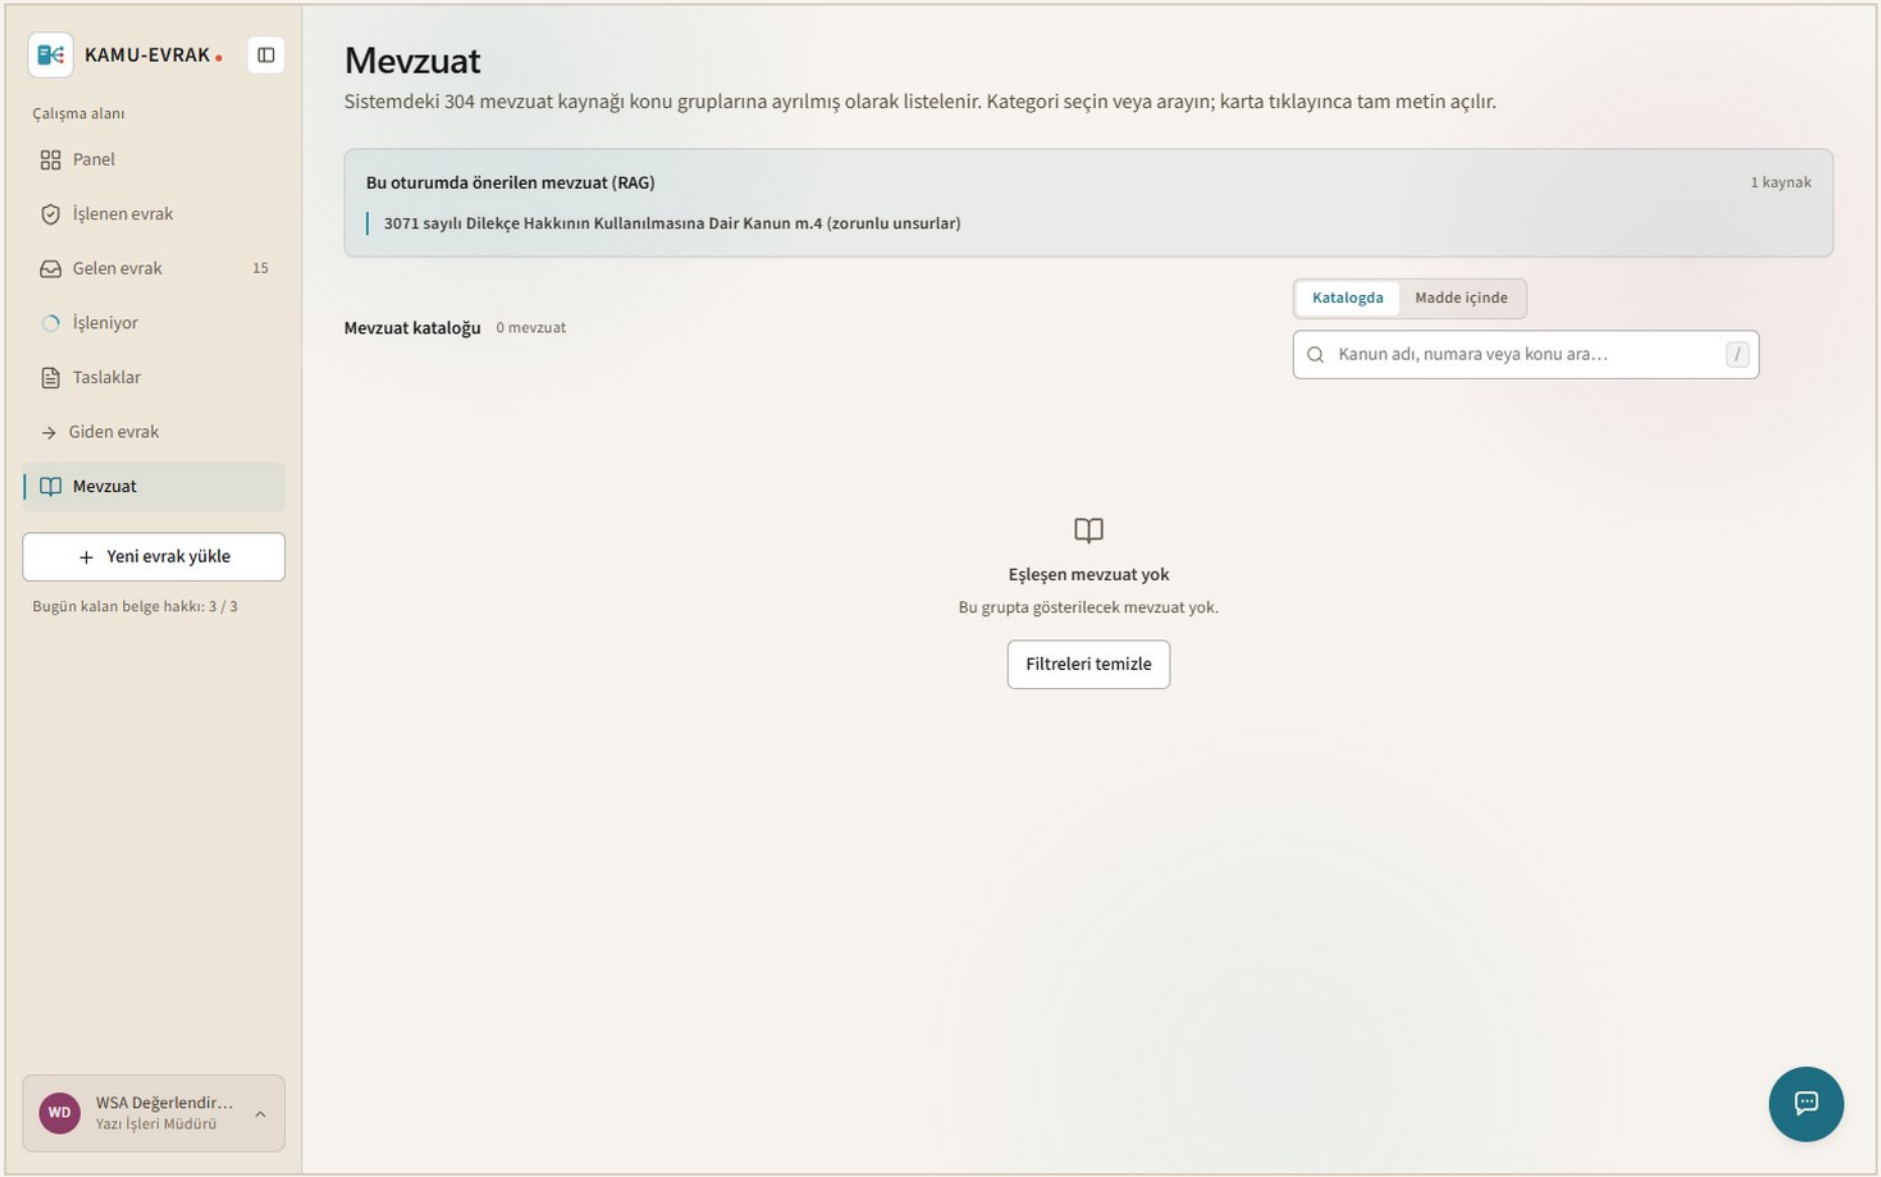

08 The officer's own archive

Processed documents persist in the user's account: what was decided, when, and on what grounds. Work is not lost between sessions.

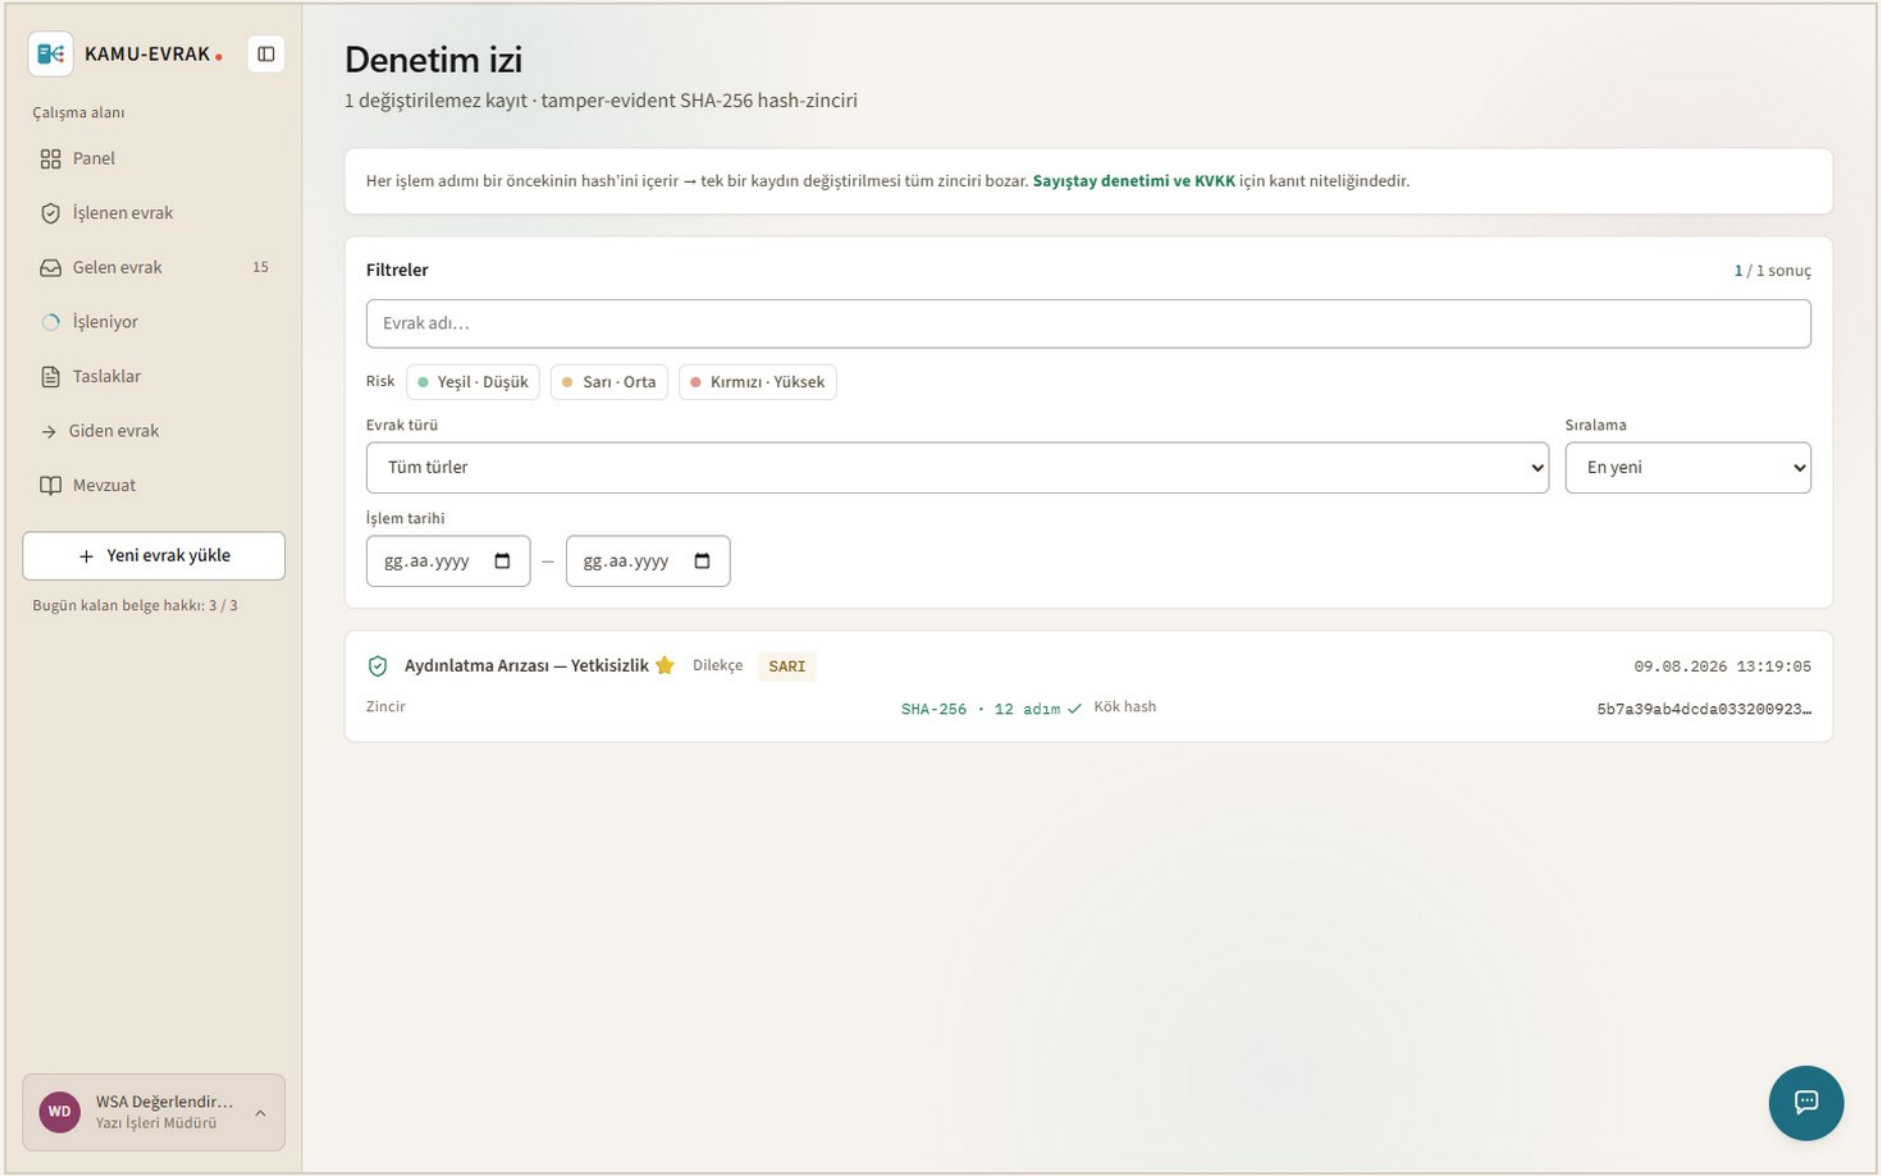

09 Legislation, browsable and citable

304 legislation sources. The assistant retrieves from this corpus and verifies every citation against the source text. A reference it cannot ground is flagged in the draft instead of being presented as fact.

10 Tamper-evident audit trail

Every run produces a hash-chained record of each step, so a decision can be reconstructed and verified afterwards. For public administration this is an accountability requirement.

11 Drafts awaiting the officer

Nothing is sent automatically. Drafts wait in a queue and the officer approves, edits or rejects. The system proposes, the human decides and signs.
